Education

University of Wisconsin–Madison — Madison, WI
B.S. Computer Sciences (AI/ML Focus), Certificates in Physics & Entrepreneurship — *Expected May 2029*

- **Awards:** 3rd Place of 40+ teams, MadHacks 2025 (UW–Madison Hackathon)

Experience

Stuard AI — Jun 2025 – Present
Founder & Lead Engineer | Local-first AI agent for Windows — *Madison, WI*

- Architected a **multi-agent orchestration engine** (TypeScript/Python, 1,190+ commits): a coordinator delegates tasks to 15+ specialized subagents (browser, computer-use, files, GitHub, Google, SMS/voice) that run in parallel and escalate clarifying questions mid-task, across 100+ LLMs.
- Built **semantic tool discovery** over 180+ tools and MCP servers: embedding search loads only the relevant tool schemas, filtered by the integrations a user has connected, keeping prompts small and cutting token cost.
- Shipped **permission-gated background agents** (auto / selective / manual approval) with an encrypted local SQLite memory where LLMs extract facts into a knowledge graph and the user confirms or rejects conflicts.
- Built computer-use and browser-extension agents for GUI automation; grew a **100+ person waitlist** with zero marketing spend.

Project Hivemind — Aug 2026 – Present
Founding Team, Computer-Use Lead — *UW–Madison*

- Leading the **computer-use** subteam for a voice-first AI agent that controls any computer through a USB-C device (composite HID keyboard/mouse + mass storage) while cloud agents handle reasoning; set up the team's Rust workspace (protocol, API, client and app crates).
- Designed the device's **memory architecture** (on-device SQLite knowledge graph + topic-based conversation log).

Projects

Reminda: SMS & Voice Reminder SaaS | *Next.js, Postgres, Telnyx, ElevenLabs, Stripe* — 2026

- Launched tryreminda.site, a live SaaS that sends reminders by **SMS and AI voice call**, with Stripe subscription billing.
- Built **scheduled dispatch** with atomic job claims, bounded retries and stale-job recovery.

Ada: AI-Native Linux Desktop | *Rust, C, Qt/QML, Python, Wayland, Wine* — 2026

- Released **Ada 1.0** (Oct 2026), a desktop OS on Ubuntu whose assistant acts through a **Live Desktop Graph**: a real-time, structured map of every window, control and text element, so agents target UI by meaning instead of screen coordinates, falling back to local OCR only when an app hides its structure.
- Designed the assistant's tool layer for files, settings, documents, windows and a paired phone: each action is checked against a fresh observation, and disruptive actions require user confirmation.

AI Storage: Agentic Disk Cleanup for Windows | *Tauri, Python* — 2026

- Built a desktop app that runs an elevated NTFS scan and lets a **tool-calling AI agent** explore the folder tree without loading every file into context.
- Paired the agent's suggestions with a rules engine and protected-path filter as **guardrails**; deletions go to the Recycle Bin with one-click undo, and the app still works without an API key.

Technical Skills

Languages: TypeScript/JavaScript, SQL, Python, Rust, C, Java, QML
Systems & Web: Next.js, React, Node.js, Windows, Linux, Tauri, Electron, Qt/QML, WebSockets
Data & Cloud: PostgreSQL, Supabase, SQLite, GCP (Cloud Run, Storage), Docker, GitHub Actions, Stripe
AI/ML: LLM agents & tool calling, MCP, prompt design, RAG/embeddings, LoRA fine-tuning, PyTorch, Hugging Face, TensorFlow
